Report

Laboratory Work No. 2

Information Security and Cryptography
Cryptanalysis of Monoalphabetic Ciphers

Checked by:
Zaica M., *university assistant*
DISA, FCIM, UTM

Chişinău – 2025

1 Objective

Study and practical application of frequency analysis techniques for breaking monoalphabetic substitution ciphers. Understand the vulnerabilities of monoalphabetic ciphers and develop skills in cryptanalysis.

2 Tasks

1. Study the concept of letter frequency analysis in different languages
2. Understand the methodology of frequency attack on monoalphabetic ciphers
3. Analyze and break a given cryptogram using frequency analysis
4. Recover the encryption key used in the cipher
5. Document the complete cryptanalysis process

3 Theoretical Background

3.1 Frequency Analysis Concept

The fundamental weakness of monoalphabetic encryption systems lies in the frequency of character appearance in the text. If an encrypted text is sufficiently long and the language of the plaintext is known, the system can be broken through a *frequency analysis attack*.

3.2 Letter Frequencies in Languages

English Language Frequencies:

The frequencies of the English language are:																									
E	T	A	O	I	N	S	H	R	D	L	C	U	M	W	F	G	Y	P	B	V	K	J	X	Q	Z
12.7	9.1	8.2	7.5	7.0	6.7	6.3	6.1	6.0	4.3	4.0	2.8	2.8	2.4	2.4	2.2	2.0	2.0	1.9	1.5	1.0	0.8	0.15	0.15	0.10	0.07

Figure 1: Execution times mean time

3.3 Frequency Attack Methodology

The most common digraphs in the english language are:

TH,HE,AN,IN,ER,ON,RE,ED,ND,HA,AT,EN

The most common digraphs in the message are:

WQ,QV,XG,VI,TG,VG,PW,QT,IV,NG,VP

Figure 2: The most common digraphs

The most common trigrams in the english language are:

THE,AND,THA,ENT,ION,TIO,FOR,NDE,HAS,NCE,TIS,OFT,MEN

The most common trigrams in the message are:

WQV,XGJ,TGO,VGW,QTO,XNG,RTP,KVI,QXP,TIO,WXN,PWT,TWX

Figure 3: The most common trigrams

The most common double letters in the english language are:

SS,EE,TT,FF,LL,MM,OO

The most common double letters in the message are:

SS,VV,PP,NN,CC,WW,UU,GG,OO,HH

Figure 4: The most common double letters

4 Practical Cryptanalysis Example

4.1 Given Cryptogram [v21]

The intercepted cryptogram is known to be obtained using a monoalphabetic cipher over an English text:

4.2 Step 1: Frequency Analysis

First, we calculate the frequency of all letters in the cryptogram:

Figure 5: Letter frequencies in the cryptogram

4.4 Step 4: Final Decrypted Text

The complete decrypted message reveals

- 1 Yardley's appropriation had been severely cut in 1924, and half the staff had to be let go, reducing the force to about a dozen. Despite this, Yardley said, the Black Chamber managed to solve, from 1917 to 1929, more than 45,000 telegrams, involving the codes of Argentina, Brazil, Chile, China, Costa Rica, Cuba, England, France, Germany, Japan, Liberia, Mexico, Nicaragua, Panama, Peru, San Salvador, Santo Domingo (later the Dominican Republic), the Soviet Union, and Spain and made preliminary analyses of many other codes, including those of the Vatican.
- 2
- 3 Suddenly it all ended. Yardley, who had been obtaining the code telegrams of foreign governments through the cooperation of the presidents of the Western Union Telegraph Company and the Postal Telegraph Company, was encountering increasing resistance from them. Herbert Hoover had just been inaugurated, and Yardley resolved to settle the matter with the new administration once and for all. He decided on the bold stroke of drawing up "a memorandum to be presented directly to the President, outlining the history and activities of the Black Chamber, and the necessary steps that must be taken if the Government had hoped to take full advantage of the skill of its cryptographers." He waited to see which way the wind was blowing before making his move and found that it was not with him. Yardley went to a speakeasy to listen to Hoover's first speech as President and sensed, in the high ethical strictures that Hoover expressed, the doom of the Black Chamber.
- 4
- 5 He was right, though its actual closing came from elsewhere. After Henry L. Stimson, Hoover's Secretary of State, had been in office the few months that Yardley thought would be necessary for him to

have lost some of his innocence in wrestling with the hardheaded realities of diplomacy, the Black Chamber sent him the solution of an important series of messages. But Stimson was different from previous Secretaries of State, on whom this tactic had always worked. He was shocked to learn of the existence of the Black Chamber, and totally disapproved of it. He regarded it as a low, snooping activity, a sneaking, spying, keyhole-peering kind of dirty business, a violation of the principle of mutual trust upon which he conducted both his personal affairs and his foreign policy. All of this it is, and Stimson rejected the view that such means justified even patriotic ends. He held to the conviction that his country should do what is right, and, as he said later, "Gentlemen do not read each other's mail." In an act of pure moral courage, Stimson, affirming principle over expediency, withdrew all State Department funds from the support of the Black Chamber.* Since these constituted its major income, their loss shuttered the office. Hoover's speech had warned Yardley that an appeal would be fruitless. There was nothing to do but close up shop.

6

7 In 1940, as Secretary of War, he had to reverse himself and accept the cryptanalyses of Magic. But the international situation then was totally different. "In 1929," he himself has written, in the third person, "the world was striving with good will for lasting peace, and in this effort all the nations were parties. Stimson, as Secretary of State, was dealing as a gentleman with the gentlemen sent as ambassadors and ministers from friendly nations. ..." In 1940, Europe was at war, and the United States was on the verge.

8

9 The Signal Corps, where William Friedman had charge of cryptology. The staff quickly dispersed (none went to the Army), and when the books were closed on October 31, 1929, the American Black Chamber had perished. It had cost the State Department \$230,404 and the War Department \$98,808.49 just under a third of a million dollars for a decade of cryptanalysis. Yardley, whose job experience had been rather specialized, could not find work, and he went back home to Worthington. The Depression sucked him dry. By August of 1930, he had had to give up an apartment house and a one-eighth interest in a real estate corporation; indeed, he complained that he had to sell nearly everything he owned "for less than nothing." A few months later he was toying with the idea of writing the story of the Black Chamber to make some money to feed his wife and their son, Jack. When his old MI-8 friend, Manly, with whom he had been in contact all during the 1920's, had to turn down his request for a \$2,500 loan at the end of January, 1931, Yardley, in desperation, sat down to write what was to be the most famous book on cryptology ever published.

4.5 Step 5: Recovered Encryption Key

Figure 12: Decrypted alphabet

5 Results and Analysis

5.1 Cryptanalysis Process Documentation

The cryptanalysis followed this systematic approach:

- Frequency Counting:** Calculated exact frequencies of all ciphertext letters
- Initial Mapping:** Matched most frequent ciphertext letters with most frequent English letters
- Pattern Recognition:** Identified common words and patterns ("THE", "TO", "ONE")
- Contextual Analysis:** Used word context to resolve ambiguities
- Iterative Refinement:** Progressively refined the substitution key
- Validation:** Verified the decrypted text made linguistic sense

5.2 Key Recovery

The recovered substitution key demonstrates the complete breakdown of the monoalphabetic cipher. The mapping shows a non-standard substitution pattern rather than a simple Caesar shift.

6 Conclusions

6.1 Main Findings

- Monoalphabetic ciphers are highly vulnerable to frequency analysis attacks
- The effectiveness increases with longer ciphertexts due to statistical convergence
- Additional linguistic patterns (digraphs, trigraphs, common words) are crucial for successful cryptanalysis
- Human judgment remains essential in the cryptanalysis process

6.2 Security Implications

- Monoalphabetic ciphers provide no real security for sensitive communications
- Even with large keyspaces ($26!$ possible keys), the statistical properties of language make them vulnerable
- These ciphers are only suitable for educational purposes or very low-security applications

6.3 Practical Applications

- Understanding fundamental cryptanalysis techniques
- Demonstrating the importance of eliminating statistical patterns in secure encryption
- Foundation for understanding more advanced cryptographic attacks
- Historical perspective on the evolution of cryptography

This laboratory work successfully demonstrated that monoalphabetic substitution ciphers, while having a large theoretical keyspace, can be efficiently broken through frequency analysis due to the inherent statistical properties of natural languages.
